

[Workshop 6] Javascript - Functions (advanced)

Brainster Web Development Academy

Table of contents

01 Exercise 01

02 Exercise 02

03 Exercise 03

04 Exercise 04

05 Exercise 05

Intro

For this week's workshop, you will need to work on five different exercises and implement the JavaScript functions that you learned during the week.

Exercise 01

- Prompt the user to enter a string (for example a sentence)
- Create a JavaScript function that finds the longest word in the given string
- Show the longest string in the console

Exercise 02

- Initialize an array with two numbers (for example [1,4])
- Create a JavaScript function that takes an array of two numbers and returns the sum of those two numbers plus the sum of all the numbers between them.
- Show the result in the console

Exercise 03

- Write a JavaScript program that has a function to flatten a nested array. The function should be able to handle varying levels of nesting
- Show the flattened array in console

Exercise 04

- Create a JavaScript function that checks whether there are two distinct indices i and j in the array such that $\text{nums}[i]$ is 2 times $\text{nums}[j]$.

Exercise 05

- Create a JavaScript function to find all the duplicates in an array where the numbers are in the range 1 to n (inclusive), where n is the length of the array.

Break a leg!

If there is not enough time, try to finish the exercises at home.
