

# Mentorship 07 - JavaScript

You have 4 exercises. Divide the work between all of you, or work together on each of them.

Objective:

Build a simple Library Management System using JavaScript, HTML and Bootstrap. The system will allow the users to add new books, display the list of books and categorize them. **You need to solve this by creating specific classes for the books and library.** Refer to the screenshots on how the view should look like and its functionality.

## Exercise 1:

- Create a *Book* class with constructor to initialize properties.
- Use the starter file for the form to input the book details (title, author, category).
- Allow users to input books in the library via the DOM.

## Exercise 2:

- Create a *Library* class with methods to add books and display them.
- Use the starter file for the section to display the list of books.
- Implement the functionality to add a book to the library and display it on the page.

## Exercise 3:

- Add a function to the Library class to filter the added books by their category.

## Notes

- Write all of the exercises in a single folder and index.html/script.js files like it is in the starter files.
- Place the challenge in a GitLab project named **\*\*mentor-classes-group-number\*\*** (example: mentor-classes-group-1, which you already created).

- Each challenge every week will be in a separate branch (DO NOT WORK ON MASTER).

**Good luck!**
