

# Mentorship 06 - JavaScript

You have 4 exercises. Divide the work between all of you, or work together on each of them.

Objective:

Build an interactive task scheduler application that allows users to add tasks with a specific duration. Each task should start after a set delay or at a specific time and user should receive a notification on the webpage when the task is completed.

## Exercise 1:

- a. Users can add tasks by adding **task name, duration (in minutes) and a delay (in minutes)** after which the task should start.
- b. Each task is stored as an object with properties for name, duration and delay.

## Exercise 2:

- a. Implement the scheduling mechanism using JavaScript timers.
- b. If a task is set with a 5-minute delay, it should start 5 minutes after being added.

## Exercise 3:

- a. When a task is completed, display a notification on the webpage.
- b. This could be a simple alert or a custom modal.

## Exercise 4:

- a. Show a list of all the scheduled tasks with their details.
- b. Include a status indicator showing whether each task is pending, in progress or completed.

## Notes

1. Write all of the exercises in a single folder and index.html/script.js files like it is in the starter files.

2. Place the challenge in a GitLab project named **\*\*mentor-classes-group-number\*\*** (example: mentor-classes-group-1, which you already created).
  - Each challenge every week will be in a separate branch (DO NOT WORK ON MASTER).

**Good luck!**
