Exercise 05

Intro

2

For this week's workshop, you will need to work on five different exercises and implement the JavaScript Objects ,that you learned during the week.

01

- Make a plain (literal) object which describes a developer.
- The object should have the following properties: fullName, age, experience & workingPosition.

It should also consist of two methods:

- The first method is getSeniority - should check and return the status of the developer. Use the experience property to check if the developer is 'junior' (0 to 1 years experience), 'medior'(1 to 3 years experience) or 'senior'(more than 3 years of experience).
- The second method is display - should return a string: e.g. 'I am James Gist, 25 years old and i am working as a javascript developer'.
- Call the two methods and see the result in the console.

02

- Rewrite the first exercise with a constructor function.
- Instantiate a new object based on the constructor function.
- Call the two methods and see the result in the console.

03

- Make an object with a constructor function which describes a car.
- The constructor function should have properties for: model, year, mileage, owner.

It should also contain three methods:

- The first method is getInfo - which returns a string: e.g. 'Ford, 2018, 100000km, owned by James Gist'.
- The second method is km - which will check and return the status of the car based on it's mileage.
- If the car has less than 10000km mileage - return a string saying 'this is a great car.'
- If the car has a mileage between 10000 and 250000km - return a string saying 'this is a good car'.

03

- If the car has a mileage more than 250000km - return a string saying 'this is an old car'.
- The third method is setOwner which will change the name of the owner of the car.
- Lastly: Call getInfo and km methods. Change the name of the owner with the third method - setOwner and call the first method getInfo again to check the new owner's name.

04

7

- Make an object with a Class called Average.
- It should take 2 parameters (numbers).
- It should have a method called calcAverage - which will calculate the average value of the two numbers and will return a string saying: e.g. 'The average value between 2 and 6 is 4'.
- Make two new instances of the class, each with 2 numbers of your choice, and a third one with numbers from prompt.
- Call the calcAverage for each instance in the console.

05

- Make an object with a class called Triangle which will take 3 parameters - for each of its sides.
- Make a method called check - which will check which type of triangle is the one - equilateral/isosceles or scalene and will return a string saying: e.g. 'The triangle with sides a 10, b 20 and c 30 is isosceles'.
- Make a new instance of the class and call the check method on it.

See the result in the console.

Break a leg!

9

If there is not enough time, try to finish the exercises at home.
