Exercise 01

Intro

2

For this week's workshop, you will need to work on an exercise where you can implement everything that you have learned about JavaScript so far.

01

3

There are starter files with a setup created for you.

- All the cards info can be found in the products.js file and you have to work in the main.js file.
- The card skeleton is shown in the html starter file (be sure to comment or remove it when you start with the javascript logic).
- ❑ The steps you need to follow are:
 - Loop over the products array and for each iteration show a card in the div with an id='list'.
 - Clicking on the '+' button opens the bootstrap modal which will be used for adding a new card to the list. Make sure all the inputs are filled with text, and only then clicking on the 'add-btn' you should add a new card to the div with an id='list' in html. For the new card ids, use the products array length.

01

4

- Clear the input values after adding a new card.
- Now that you've added a new card in html, create an object similar to the ones in the products.js file and add it (push it) to the products array as well.
- Clicking on the 'del-btn' in html, remove the correspondent card from the html file and from the products array also.
- Now that you've removed the card, the id's of the elements are shuffled, meaning: when you attempt to add a new card, two or more cards can have the same ids. In order to fix that, loop over the cards again and update their ids after clicking on the 'del-btn'.
- Clicking on the 'search-btn' you should filter/search through all the cards based on their titles.
- Optimize your code: use one function called renderCard to render the same html you are rendering in 3 places.

Break a leg!

5

If there is not enough time, try to finish the exercises at home.
