

Mentorship 04 - JavaScript

You have 5 exercises. Divide the work between all of you, or work together on each of them.

Exercise 1:

- a. You are responsible for the information of an Product Inventory Management, given by an array in the starter file, which has the ID, name, quantity, and price of some electronic products.
- b. Iterate through the array and create a dynamic table and fill the rows of the table accordingly as displayed in the **screenshot1**.
- c. Use `document.createElement` for each iteration. Everything must be done using Javascript inside the `<script.js>` file.
- d. Use CSS or Bootstrap classes only for styling the table.
- e. **Refer to the previous mentorship exercise for this solution.**

Exercise 2:

- a. Continuing from exercise01, based on the quantity and price columns, create a function that calculates the value for each product.
- b. Use JavaScript to append a new column 'Product Value' and display the product data on this new column accordingly as displayed in the **screenshot2**.
- c. **Refer to the previous mentorship exercise for this solution.**

Exercise 3:

- a. Create a custom JavaScript function that calculates the total value of all the products in the inventory.
 - i. Use the array method `reduce`.
 - ii. See **screenshot3**.

Exercise 4:

- a. Create a custom JavaScript function that filters the products by quantity: show products with quantity more than 10 for example.
 - i. Create a new function to dynamically create the table and only display the ID and Name columns.
 - ii. This function will be named `createFilteredTable` and its parameters will be the data (products) and **tableId** in order to append this new table in the div with the id 'filteredTable'. Pass **filteredTable** as a string.

- iii. See **screenshot4**.

Exercise 5:

- a. Continuing from exercise 04, create a custom JavaScript function that highlights rows with ID bigger than 105.
 - i. Pass this callback function to the function that creates the filtered table.
 - ii. The function `createFilteredTable` will have another parameter which is `rowCallback`. Modify the logic inside this function to call the callback if it passes as a parameter.
 - iii. Pass **highlightedTable** as a string to its **tableId** parameter so it gets appended to the correct div.
 - iv. See **screenshot5**.

Notes

1. Write each of the exercises in a separate folder and `index.html/script.js` files like it is in the starter files.
2. Place the challenge in a GitLab project named ****mentor-classes-group-number**** (example: `mentor-classes-group-1`, which you already created).
 - Each challenge every week will be in a separate branch (DO NOT WORK ON MASTER).

Good luck!
