01 Exercise 01

02 Exercise 02

03 Exercise 03

04 Exercise 04

05 Exercise 05

Intro

For this week's workshop, you will need to work on five different exercises and implement the JavaScript callback functions that you learned during the week.

Exercise 01

- Create a JavaScript function **`operationOnSum`** that takes as parameters 2 numbers and 1 callback function
- The **`operationOnSum`** function calculates the sum between the first 2 number parameters, and passes the result to the callback function
- Create 2 callback functions which can be passed on the original function **`operationOnSum`**
- The first callback function **`divideByHalf`** takes the sum calculated and divides it by half
- The second callback function **`multiplyByTwo`** takes the sum calculates and multiplies it by two
- Show in console the results when we pass the first callback and then the second callback

Exercise 02

- Create a JavaScript that uses `map` and `reduce` to create a function that returns the sum of the squares of each number in an array

Exercise 03

- Create a JavaScript function that takes as parameter an array of words (strings) and uses map to return a new array with each word capitalized.

Exercise 04

- Create a JavaScript function that takes an array of numbers, modifies each number using a callback (e.g., multiplies by 3), and then uses another callback to aggregate the results into a single value (e.g., the sum of all numbers).

Exercise 05

- Create a JavaScript function that tries to perform an operation (a callback function) and if it fails, retries the operation up to a specified number of times before giving up.

TIPS:

1. *Create a custom function that generates a random number which indicates the retries.*
2. *Use try and catch block for the retryOperation function*

Break a leg!

If there is not enough time, try to finish the exercises at home.
