Intro

For this week's workshop, you will need to work on eight different exercises and implement the JavaScript events that you learned during the week.

Exercise 01

- There is a html starter file with 2 inputs and a paragraph inside.
- Whenever you focus (click) on the inputs, it should show a help text for that field you are currently focusing on in the paragraph below the inputs.
- The help text can be found in a data attribute in each of the inputs (do not write your own help text, use that one).
- Whenever you click outside of the inputs, it will clear the help text.

Exercise 02

- There is a html starter file with a div inside.
- Create a JavaScript function that displays the x and y coordinates of the mouse in the div element as you move the cursor across the screen.

Exercise 03

- There is a html starter file with 2 divs inside.
- Write a JavaScript program where they both become opaque but the first div increases their size while the second div decreases its size (shrinks) upon mouse hover.

Exercise 04

- In the starter file there are 2 div in the HTML that change based on specific user events.
- When clicking the button, the first div changes its background color to red.
- When moving the mouse over the second div, the text changes to 'Move out the mouse to send me back' and the text rotates 180 degrees. When you move the mouse out this div, the text goes back to its place in its original form.

Exercise 05

- There is a html starter file with a setup created for you.
- Each time you click on the button you should change the following things randomly:
 1. Change the background-color of the body
 2. Change the author quote (from the authors array).
 3. Change the quote text (from the quotes array)
 4. Match the quote to the author!

Exercise 06

- There is a html starter file with a setup created for you.
- When you click on the submit button:
- If you have the correct answers checked, the questions should be colored in green.
- If you have the incorrect answers checked, the questions should be colored in red.
- When you click on the reset button all the questions should revert to white color, and all the checkboxes/radio inputs should be unchecked.

Exercise 07

- Use the starter file and create a custom JavaScript function that filters out the array of fruits based on user input.
- When you first come to the page, show all the fruits as `<li>` elements inside the `<ul>` list in html.
- When you start typing in the input, it should start filtering the fruits by the letters typed in the input (letter by letter) and display only those ones in the ul list.

Exercise 08

- Use the starter file and following from the previous exercise with the array of fruits/
- When you first come to the page, show all the fruits as `<li>` elements inside the `<ul>` list in html.
- Create a custom JavaScript function to start navigating up and down the list of fruits with your keypress events (key up and key down)
- Highlight the item where you are positioned
- When you press Enter, show an alert with the name of the selected fruit

Break a leg!

If there is not enough time, try to finish the exercises at home.
