

# Workshop - Asynchronous JavaScript

## Exercise 1:

Using the Users API: <https://reqres.in/api/users> add the query parameter page which will get data from the corresponding page. API response consists of 12 total items, each divided into 2 portions. For example, <https://reqres.in/api/users?page=1> will get the first 6 items.

Create a simple table view for this response and utilize the pagination.

According to the **total\_pages** property in the response, render the appropriate number of pagination buttons.

Each button should be clickable and on each click, a new portion of the API response should be fetched.

As data is fetched, render the next page on the screen.

---

## Exercise 2:

Using the weather API,

- [http://api.openweathermap.org/data/2.5/forecast/daily?q=\\${city}&units=metric&cnt=\\${days}&APPID=c10bb3bd22f90d636baa008b1529ee25](http://api.openweathermap.org/data/2.5/forecast/daily?q=${city}&units=metric&cnt=${days}&APPID=c10bb3bd22f90d636baa008b1529ee25)

weather images API

- [http://openweathermap.org/img/w/\\${weatherIconNamePlaceholder}.png](http://openweathermap.org/img/w/${weatherIconNamePlaceholder}.png)

search for city Name and number of days for the forecast.

*\*\*For better understanding, try to execute and explore the API end points before starting to code.*
